EXPERIMENT

Sanger Screening and Expansion of First-Round Mutants

BRANCH	DATE	EXPERIMENTER
Apobec	2026-08-28	Yunxiang Zhang

Experimental Summary

Sanger reads were compared with the REWIRE Pro.hA1 parental sequence. Selected plasmids were retransformed using 25 µL competent cells and 3 µL plasmid, and 6 mL ampicillin-containing LB cultures were started at 37°C and 220 rpm overnight.

Results

Twenty-nine mutant groups passed screening, with the intended mutations and no additional variants detected within the sequenced regions. Cultures were initiated for plasmid preparation.
