EXPERIMENT

mCherry Electroporation Voltage Screen in CCF-STTG1

BRANCH	DATE	EXPERIMENTER
FV	2026-09-22	Hansen Zhang

Experimental Summary

CCF-STTG1 cells were electroporated with the mCherry-only plasmid across the voltage-screen conditions. The associated experiment record specifies 100,000 cells and 0.5 micrograms DNA per group.

Results

Electroporated samples proceeded to flow cytometry 72 hours later, on 25 September.
