EXPERIMENT

Gfa Promoter Expression without MRE

BRANCH	DATE	EXPERIMENTER
Gfa	2026-08-30	Hansen Zhang

Experimental Summary

Collected GFAnoMRE and CMVnoMRE samples from HEK293T and U251 cells were processed by RNA extraction and reverse transcription. Editor, GAPDH and ACTB were measured by 10 microlitre SYBR qPCR, with technical duplicates for three culture-well samples per group, NTCs and a positive cDNA pool.

Results

GFAnoMRE showed lower normalized editor expression than CMVnoMRE in HEK293T and higher expression in U251. Editor NTC amplification limited the reliability of precise fold-change estimates.
