EXPERIMENT

Construction of the First P5 Mutant Panel

BRANCH	DATE	EXPERIMENTER
PUF	2026-07-27	Xiaoyu Que

Experimental Summary

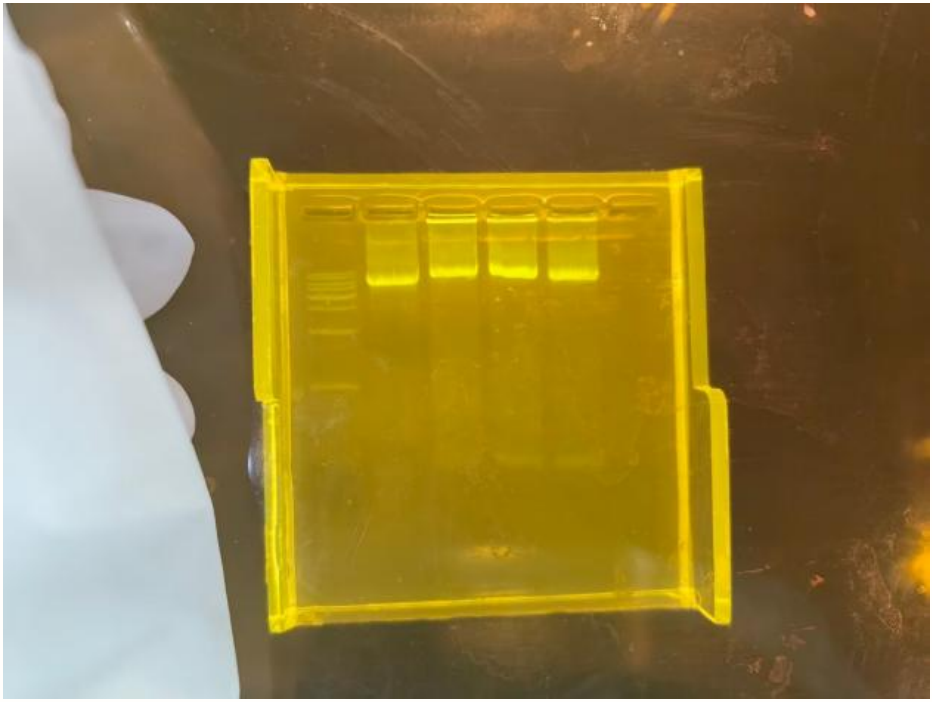

Sixteen P5 variants were amplified by PCR, treated with DpnI, and gel-purified. The products were assembled with CE mix V3 at 50 °C for 15 min, then transformed into DH5α and plated.

Results

All 16 groups subsequently produced colonies. Initial sequence screening accepted 10 constructs and identified sequence problems in SRE, DWE, VFN, LRD, THN, and SFE; repeated gel checks later attributed the long smears to excessive sample loading.
