EXPERIMENT

Sequence Screening of WT, AC and InAC Reporter Clones

BRANCH	DATE	EXPERIMENTER
Reporter	2026-08-20	Hansen Zhang

Experimental Summary

Two candidates each for WT, AC and InAC were screened by sequencing across the reporter target and assembly junctions.

Results

The 20 August readout comprised 18 chromatograms, including one weak-signal read. The subsequent review on 24 August supported the designed target sequence and assembly junction in all six candidates, without establishing complete-plasmid identity.
