EXPERIMENT

Flow Cytometry of the Initial Reporter Comparison

BRANCH	DATE	EXPERIMENTER
Reporter	2026-08-24	Hansen Zhang

Experimental Summary

MOCK, WT, AC and InAC samples from the 22 August transfection were measured by flow cytometry.

Results

AC showed higher EGFP fluorescence than WT and InAC, but both intended OFF-state reporters remained well above MOCK. The pilot established fluorescence separation without a clean low-EGFP OFF state.
