EXPERIMENT

Flow Cytometry of the Reporter Dose and Editing Comparison

BRANCH	DATE	EXPERIMENTER
Reporter	2026-08-28	Hansen Zhang

Experimental Summary

The reporter-dose series and the initial reporter/editor cotransfection samples were measured by flow cytometry as one experiment with a shared MOCK control.

Results

The active-editor candidate did not produce the expected turn-on relative to the inactive-editor comparison. Higher reporter doses showed substantial high-end EGFP clipping, limiting quantitative interpretation.
