EXPERIMENT

AAV-mCherry Genome Quantification by qPCR

BRANCH	DATE	EXPERIMENTER
AAV	2026-09-26	Hansen Zhang

Experimental Summary

AAV9-CMV-mCherry was tested with the Beyotime C2921S kit using the revised 18-well plan. The plate contained six standards, 5-fold and 50-fold sample-lysate dilutions, and NTCs, all in duplicate, with 5 µL template in each 20 µL reaction.

Results

Both sample dilutions amplified, while the NTCs were undetected. The 5-fold dilution gave an extrapolated genome titer of approximately 2.7 × 10^8 vg/mL; both dilutions were below the standard-curve range, so this was a rough estimate and did not establish transduction activity.
