EXPERIMENT

Sanger Screening and Expansion of Second-Round Mutants

BRANCH	DATE	EXPERIMENTER
Apobec	2026-09-19	Yunxiang Zhang

Experimental Summary

Returned Sanger results were reviewed against the REWIRE Pro.hA1 parental sequence. Selected plasmids were retransformed using 40 µL competent cells and 5 µL plasmid, and 6 mL ampicillin-containing LB cultures were started at 37°C and 220 rpm overnight.

Results

Eleven additional mutant groups passed screening, bringing the total across both rounds to 40. Acceptance required the intended mutations and no additional variants within the sequenced regions.
