EXPERIMENT

APOE Sequencing in the Initial 10R Comparison

BRANCH	DATE	EXPERIMENTER
Fundamental	2026-07-01	Hansen Zhang

Experimental Summary

The initial core-editor comparison was assessed by APOE amplicon sequencing. The comparison retained the 10R, PUF-only, APOBEC-only and empty-vector groups, with biological and technical samples kept distinct. Lower-depth and resequencing outputs represented the same sample batch.

Results

The 10-repeat editor showed strong target C-to-T signal together with extensive bystander changes across the assayed APOE region. The component-only and empty-vector comparisons showed much lower target signal.
