EXPERIMENT

APOE Sequencing in the PUF-Length Editor Comparison

BRANCH	DATE	EXPERIMENTER
Fundamental	2026-07-18	Hansen Zhang

Experimental Summary

Editors labeled 10, 12, 13, 15, 132D and E72A were compared in transient-reporter 293T cells and the separate PCOH1 and PCOH2 cell lines. The sequencing set contained two biological samples per condition, for 36 samples in total.

Results

Editor 10 gave the highest target signal in the transient and PCOH2 contexts, while editor 12 ranked highest in PCOH1. Target editing was accompanied by context-dependent bystander changes; 132D reduced the overall burden but retained a premature-stop hotspot.
