EXPERIMENT

GFAP Expression in U251 and HEK293T Cells

BRANCH	DATE	EXPERIMENTER
Gfa	2026-08-12	Hansen Zhang

Experimental Summary

cDNA from three U251 and three HEK293T samples was assayed for GFAP, S100B, SLC1A3, GAPDH and ACTB using the M0D1 protocol. SYBR qPCR was performed in 20 µL reactions with technical duplicates and an NTC for each assay.

Results

GFAP signal was markedly higher in U251 than in HEK293T, supporting the choice of U251 for subsequent Gfa validation. S100B was excluded from interpretation because its NTC showed strong amplification with a sample-like melt peak.

PROTOCOL

M0D1 GFAP qPCR, protocol-3; M11: SYBR Green qPCR
