EXPERIMENT

Editor Expression with Gfa and MRE Modules

BRANCH	DATE	EXPERIMENTER
MRE	2026-08-21	Hansen Zhang

Experimental Summary

HEK293T and U251 samples from the first Gfa/MRE comparison were collected and processed through RNA extraction and reverse transcription. Editor, GAPDH and ACTB were then assayed using the retained two-plate qPCR layout, with culture-well samples, technical duplicates, NTCs and an inter-plate calibrator.

Results

> CMV+MRE samples showed lower normalized editor expression than the CMV controls in both cell lines. Target-like NTC amplification, variable Gfa+MRE replicates and poor U251 condition at collection limited interpretation; this run did not establish the intended selective-expression pattern.

PROTOCOL

GFAMRE two-plate 10 µL qPCR operation protocol v1.1; M11: SYBR Green qPCR
