EXPERIMENT

Sequencing Readout of the First Gfa/MRE Comparison

BRANCH	DATE	EXPERIMENTER
MRE	2026-08-23	Hansen Zhang

Experimental Summary

The HEK293T chromatograms from the first Gfa/MRE comparison were inspected. The original TE, TC, TM and TG submission labels were retained; the EV and CMV comparison used the same APOE4 substrate.

Results

The original TE chromatograms showed strong target-site signal, whereas the original TC chromatograms showed no detectable edited-channel peak. Sanger peak fractions were used as semiquantitative readouts.
