EXPERIMENT

P5 and P7 Colony Culture for Sanger Sequencing

BRANCH	DATE	EXPERIMENTER
PUF	2026-07-29	Xiaoyu Que

Experimental Summary

Single colonies from P5 and P7 plates were inoculated into 2 mL of ampicillin-containing LB and cultured at 37 °C for 12-16 h. One-millilitre aliquots of turbid cultures were submitted for Sanger sequencing.

Results

Liquid cultures and sequencing submissions were completed for the selected P5 and P7 clones.
